Introduction

Malignant hyperthermia (MH) is a potentially life-threatening illness that occurs following exposure to certain triggering agents, typically anesthetic agents, administered during surgery. The signs and symptoms of MH can rapidly progress to cardiac or respiratory arrest, and death if not treated promptly. Therefore, nurses mixing dantrolene at the same time preparation must be done every five minutes, it can become time consuming and minutes, it can become time consuming and may be very stressful when nurses are mixing dantrolene at the same time. It is possible that dantrolene is used to treat malignant hyperthermia within 15 minutes, it can become time consuming and may be very stressful when nurses are mixing dantrolene at the same time. It is possible that dantrolene is used to treat malignant hyperthermia within 15 minutes, it can become time consuming and may be very stressful when nurses are mixing dantrolene at the same time.
